Maintaining energy and power resilience across the UK

Organisations operating within critical power have been utilising our fuel maintenance contracts for over 10 years. They are a key pillar of their business continuity plan for their clients.

We understand the criticality of the products and services provided within these contracts to ensure maximum uptime should any issues occur with the Grid, whilst also understanding that not all customers require all the services within these contracts.

That's why we offer a completely bespoke contract for each customer dependant on their requirements, which are fully explored and understood in an initial 'customer understanding' workshop that our critical power sector specialist will carry out with you.

Why it's important to act:

80%

of data centres have experienced some type of outage in the past 3 years that could have been avoided.

3-4
months

is the time stored fuel starts to degrade.

25%

of backup generator failures are fuel related.

Fuel maintenance contracts for total business resilience

With a WP Group fuel maintenance contract you will receive:

24/7 emergency response

We provide 4, 8, and 12-hour response times through our 24/7 delivery retainer service. No matter the time, we will be there within the agreed emergency SLA.

Fuel sampling

We attend your site at a frequency of your choice (typically bi-annually or quarterly) to take fuel samples and provide an analysis report that is fully verified by a 3rd party laboratory.

Fuel services

From tank cleaning and servicing to fuel polishing and site audits, our range of fuel services lets us take care of your infrastructure and fuel products, so you don't have to worry.

Fuel maintenance services

With our bespoke fuel maintenance contracts, choose from the following fuel services and build the right mix for your business.

Environmental Site Inspection/Audit

A thorough visual inspection checks that your fuel storage meets the latest environmental and fuel storage regulations. The backbone of your planned preventative maintenance programme providing you with key information on your fuel storage set-up and compliance.

Tank Cleaning

As part of your planned preventative maintenance or as enabling works, we provide gas-free certification for all manned entry tasks. Have confidence in knowing it's all handled by our team of trained and certified engineers.

Tank Service

Routine in-depth tank inspections will establish their condition and if they remain suitable/safe for storing fuel. These inspections ensure the prevention of leaks, tank collapse and environmental knock-on effects that can be avoided. Our Non-Destructive Testing (NDT) will ensure your tank is always fully compliant and operational.

Fuel Polishing

At any point where fuel contamination or degradation may occur, fuel polishing is recommended. Fuel within your tank is removed and passed through a filtration unit, where any sediments and microbial contamination is removed. The restored clean fuel is then put back into your tanks. Fuel polishing removes the particulate matter, microbial growths and water from your fuel which may cause tank or engine failure. Our fixed or mobile units can be brought to your tank for peace of mind.

Fuel Transfers and Uplifts

In the event that you need to make a transfer of fuel from one tank to another, it can be easily done with our fuel transfer service. This is done with one of our tankers or through our fuel polishing system. From time to time your fuel may need to be moved between tanks or removed from site. Using our fuel polishing equipment, we can safely transfer fuel between tanks without the risk of transferring contaminants. Fuel can be removed from site and disposed of through our licenced waste disposal partner.

solutions for
your business

The benefits of switching to HVO

The quest for ever-increasing levels of sustainability and efficiency is driving change and shaping the world around us. HVO is the perfect fuel to support you to achieve your sustainability objectives.

Fully reportable reduction of carbon supporting sustainability objectives

Produced from 100% sustainable renewable waste feedstocks; sustainability certification is available with every order

Accredited with EN15940 standard for paraffinic fuels

Drop-in replacement for standard diesel and gas oil- no retrofit required

CFPP (Freezing Point) of -40°C

Reduced maintenance requirements with a storage life of over 10 years

Reduces NOx (Nitrogen Oxides) emissions by 30% and PM (Particulate Matter) by 70%

Discover how much carbon you could be saving by switching to HVO using our Carbon Savings Calculator.
